Braino

Building got easy. Being seen did not.

Vibe coding made shipping a weekend job. Nothing did that for distribution. Two products, one character: a companion for everyone, and a co-founder for the people who shipped something and heard nothing back.

What problem are you solving?

Two problems. The second one is the one nobody fixed.

EVERYONE · BRAINO COMPANION

Your AI is in a tab. Your work is not.

It remembers you perfectly, inside its own app. It just cannot reach anything outside it.

- It answers. You are still the one clicking and copying
- It cannot see the screen you are actually working on
- What it knows stops at the edge of its own product

FOUNDERS · BRAINO FOUNDRY

You shipped it. Nobody saw it.

Lovable, Cursor and Replit made building 10x easier. So there are 10x more products and the same number of people looking.

- Building stopped being the bottleneck in 2025
- Distribution became it, and stayed there
- Most products that ship are never seen by anyone

Distribution should be as easy as vibe coding. That sentence is the whole company. Every tool on the market helps you make the thing. Almost nothing helps you get it in front of a human, and the founder is the one person with no time to learn how.

Who is your customer? Clearly define your ICP.

Everyone is the audience.
Founders are the customer.

THE AUDIENCE · FREE TO $15

Braino Companion

Students, professionals, researchers. Anyone who spends the day on a screen. Mac and Windows.

- Feels the context problem daily, without naming it
- Costs almost nothing to reach: word of mouth
- Becomes the top of the funnel, and the founders inside it

THE CUSTOMER · $50 A MONTH

Braino Foundry

Solo and two-person founders, idea stage to first traction. English speaking. Already paying for AI tools.

- Has shipped something and heard nothing back
- Cannot hire a marketer and will not learn to be one
- Is reachable: they describe this exact pain in public

Beachhead: my own cohort. Three to five founders in the same building, with the problem right now, who will tell me the truth to my face. The next slide is exactly who that person is, and why they are the one worth building for.

Who are you building for, and why are they the right customer?

The founder who already shipped it.

THE PROFILE

WHO	**Solo or two-person founder.** Technical enough to ship. Not a marketer, and does not want to become one.
WHERE	**India first.** My own cohort, then Bengaluru, Delhi and Mumbai. English-speaking builders elsewhere after that.
STAGE	Product is live. Pre-revenue, or the first handful of users.
HOW THEY BUILT	With AI. Lovable, Cursor, Replit, Claude. Weeks, not quarters.
ALREADY PAYS FOR	Two or three AI tools, a domain, hosting. The budget line exists.
THE MOMENT	**They launched. They posted once. Nothing happened.**

WHY THEY ARE THE RIGHT CUSTOMER

1. **The pain repeats every week.** They ship, and nobody sees it, again. A weekly wound is a subscription. An annual one is not.
2. **The budget is already spent, on the wrong half.** They pay for tools that help them build. Nothing they own helps them get seen.
3. **They are findable in public.** They describe this exact problem, in the present tense, on Reddit and X. Engine five is aimed at them by design.
4. **Vibe coding creates more of them every day.** Every new AI builder is a new person with a distribution problem. The market grows with the thing causing it.

How big is the opportunity? TAM, SAM and SOM.

A big market to sit in.
A small, real slice to win.

TAM

$126B

Everyone paying for an AI assistant, plus everyone paying for marketing and distribution software, worldwide.

SAM

$12B

~20M English-speaking people building software with AI who are not professional engineers, at $600 a year.

SOM

$11M

Annual recurring revenue by year three. 0.09% of the serviceable market, reached bottom up.

GETTING TO $11M	CUSTOMERS	PRICE	REVENUE
Braino Foundry Founders, the paying core	10,000	$50 / month	$6.0M
Companion Pro The audience that converts	30,000	$15 / month	$5.4M

Year one is deliberately not on this table. It is three to five founders in my own cohort, run by hand, for free. **The first year buys the spec, not the revenue.**

What is your product or service?

Two products. One character.

Same face, same voice, same memory. What changes is how much of the company he is allowed to run.

MAC AND WINDOWS

Braino Companion

An assistant that can see your screen, remembers you, and does things instead of describing them.

- Reads what you are looking at, no pasting
- One memory across every app, not one per tool
- Talks out loud, and opens the tab himself
- Free, or $15 a month with no ceiling

MAC · THE CO-FOUNDER

Braino Foundry

Everything the Companion does, plus the two jobs that decide whether a company happens.

- **Braino Code.** Say it out loud, he builds the product
- **Distra.** Six engines that get it seen
- Runs on a server, not on your laptop
- $50 a month, both engines

The actual product

Distribution is not one job. It is six.

01 RUNNING

Content

Posts everywhere, in your voice, from what you shipped that week.

02 NEXT

Optics

Gets you named when someone asks an AI for a tool like yours.

03 PLANNED

Outbound

Finds the right people and writes to them like a person would.

04 PLANNED

Inbound

Answers at midnight, qualifies, and books the meeting.

05 PLANNED

Research

Listens for people describing your problem right now.

06 PLANNED

Glue

Makes the other five talk. This is the part nobody sells.

Every engine is the same four steps, connect then decide then do then check, so the spine gets built once and each new channel is a thin adapter. Content publishes today on X and Reddit, and Reddit goes through the founder's own browser with no API key at all. **Five tools that do not know about each other is the real problem. Glue is the moat.**

How is it 10x better than the alternatives available today?

Nobody else holds both ends.

THE ALTERNATIVE	WHAT IT DOES	WHERE IT STOPS
ChatGPT, Claude	Answers anything, remembers you	Lives in a tab. No eyes on your screen, no hands on your machine
Lovable, Cursor, Replit	Builds the product	Hands you a URL and wishes you luck
Buffer, Hootsuite	Schedules the post	You still have to write it, and know what to say
A marketing agency	Does the work	$5K a month, a two-week lag, no product context
Braino Foundry	**Idea, to shipped, to seen**	**Sees your machine. One memory across both jobs**

The 10x is not a smarter model. Everybody rents the same models. **It is that one thing spans building and distribution, on your actual machine.** Something that watched you build the feature already knows what Tuesday's post is about. Four products stitched together never get you that, however good each one is on its own.

How will you make money?

Flat prices. No credit maths.

TIER	WHO	PRICE	WHY THEY PAY
Free	Everyone	$0 Capped by session	Meets him properly before deciding
Companion Pro	Daily users	$15 / month	They open him more often than their email
Braino Foundry	Founders	$50 / month	Both engines. Cheaper than one hour of a marketer
Foundry, run for you	First cohort	Free Fellow builders	I run their distribution by hand, and it becomes the product

Nobody has ever enjoyed working out what 1,500 credits buys them, so there are no credits anywhere. **The first cohort is free on purpose.** They are my batchmates, they will tell me the truth, and whatever I end up doing twice by hand becomes code. Whatever I do once, I never build.

Where it is today

Four months. Not a slide deck.

BUILT

1,154

Commits since the May pivot. 79 database migrations, 18 live backends.

RUNNING

4

Surfaces in private testing: Mac, browser, web and the voice layer.

NEXT

3 to 5

Founders in my cohort whose distribution I run by hand, free, starting soon.

Braino is pre-release and the site is a waitlist, which is the honest status. The engines are real, the character is real, and the thesis has not moved since May. **Building is solved. I am building the other half.**
